FIMMAS provides fast, cost-effective, full-function support for a wide range of products.

FIMMAS provides full-function, client-based, on-line administrative support for Membership Group, Employer Group, and Individual products in a single, integrated system, including modules for application entry, underwriting, policy administration, agent administration, commission processing, billing and collections, reporting, contract accounting, customer service, claims, valuation, and reinsurance. This gives you simplified access to accurate information across business areas, and total client support across products. It also provides a standardized computing platform, with a common interface for all users.

FIMMAS easily accommodates new product types and features.

FIMMAS allows unprecedented flexibility in defining rates, rules, and factors for new products. With its rules-based, table-driven design, **FIMMAS** streamlines the process of defining and administering innovative product offerings to meet changing market needs. Product setup is designed to be a user function rather than a technical function. **FIMMAS** allows products and rate tables to be cloned or copied to serve as the basis for a new plan. New products can point to rules and tables already defined for existing products. Existing files and tables can serve as the basis for new plans. Because **FIMMAS** is a rules- and table-driven system, rate tables may vary by a wide range of user-defined parameters, such as date band, volume band, unit basis, or geographical area. The same definition of rate table rules and factors may be connected to any number of plans and benefits.

FIMMAS is a client-based system, providing a consolidated view of each customer's product portfolio and relationships.

The **FIMMAS** client database tracks information about any individual with a relationship to your company. Client, policy, and financial history information is integrated into a single database containing relationship links that tie entities together. Questions from beneficiaries, policyholders, and management can be answered on the first call, without the need to request paper files or wait for batch updates. This consolidated source of client information gives you an integrated marketing and management resource, and simplifies the process of integrating client data from **FIMMAS** with other corporate databases.

FIMMAS is an online, real-time system.

All processing in **FIMMAS** is online, real-time. All jobs are accessible through menus and can be run on demand by anyone with proper authorization. Online, remote access options allow authorized users at any location to inquire into policy and client information, enter data, run reports, and download information for analysis. The interface can be tailored to the particular needs of different departments, different users, or different companies.

FIMMAS flexibility streamlines customization to changing business needs.

Most of the items requested are already built into the **FIMMAS** base system. When modifications are needed, the built-in flexibility of **FIMMAS** streamlines customization to your products and procedures. As important as it is to find a base system that closely matches your current requirements, it is also crucial that you find a system that is truly flexible and adaptable to changes in products, procedures, rate calculations, regulations, and workflow design. **FIMMAS** offers this dynamic solution. Its rules-based, table-driven, user-controlled structure keeps you from getting boxed in with a static solution to changing needs. This means you can respond quickly to new marketplace demands and new marketing opportunities while you continue to maintain a high level of support for current policyholders.

FIMMAS provides scalable, flexible configuration options.

With its open-systems, client/server environment, **FIMMAS** provides excellent value and performance, almost limitless capacity for growth, and powerful security and network management features that support 24/7 operations. A highly productive programming environment offers quick adaptability to change, ease of training, and simplicity of use. The use of scalable, standard components means you can easily add or change functions, work unit design, and hardware/software components as needed, without changes to application software. Extensive user exits simplify integration with mainframe, Web-based, or PC-based applications. This helps you incorporate custom, in-house, or specialized third-party systems into a single, integrated solution.
